Overview

What is a grid connected PV system?

Grid connected PV systems always have a connection to the public electricity grid via a suitable inverter because a photovoltaic panel or array (multiple PV panels) only deliver DC power. As well as the solar panels, the additional components that make up a grid connected PV system compared to a stand alone PV system are:.

How does a grid-tie Solar System work?

This system allows homeowners to feed excess energy back into the grid, leveraging a grid-tie inverter for dual power exchange between the home and the utility grid. Key components of a grid-tied solar system include solar panels, a solar grid-tie inverter, and a net meter.

What is a stand alone solar system?

Stand alone solar systems are self contained fixed or portable solar PV systems that are not connected to any local utility or mains electrical grid as they are generally used in remote and rural areas.

What is a grid tied inverter?

Grid-tied inverters are used in solar power systems to convert the DC power generated by solar panels into AC power, which can be fed into the main grid for consumption or sold back to the utility company.
