## Overview

---

What is the role of storage in the Portuguese power system?

**Abstract** The main goal of this thesis is to study the role of storage in the context of the Portuguese power system. Portugal is one of the countries in the world with more installed storage capacity, namely pumped hydro storage (PHS). Most of this work has been focused on the development to 2030 and the implications of increasing RES levels.

Should energy storage be democratised in Portugal?

Energy storage is therefore essential if EU targets are to be met. Portugal's installed energy storage capacity is still predominantly based on hydro pumping, which currently stands at 4,164 GW year. However, this paradigm is about to change with the democratisation of energy storage solutions through wind and solar production.

What are the objectives of the modelling of the Portuguese power system?

The objectives of the modelling of the Portuguese power system are the following: • The prediction of the energy mix for 2030. • The prediction of the utilisation of the storage capacity, namely with projections of the energy consumed by pumped hydro storage (PHS). • The prediction of CO<sub>2</sub>.

Why is energy storage important in Portugal?

Renewable energies are inevitably vulnerable to variations in availability, since the sun and the wind cannot be programmed. Energy storage is therefore essential if EU targets are to be met. Portugal's installed energy storage capacity is still predominantly based on hydro pumping, which currently stands at 4,164 GW year.
