

How many times does it count as a battery with two charges and two discharges

Overview

Does a full charge count as a cycle?

When you charge your battery to 100%, it counts as one cycle regardless of how much battery percentage it had before charging. Similarly, when you let the battery drain to 0%, it also counts as one cycle. It's important to note that partial cycles do not count towards the battery's cycle count.

Do partial cycles count towards a battery's cycle count?

It's important to note that partial cycles do not count towards the battery's cycle count. For example, if you charge your battery from 50% to 100%, it will not count as a full cycle. The cycle count only increases when the battery has gone through a complete charge-discharge cycle.

How does a battery cycle count work?

Each time a battery goes from full charge to full discharge and back to full charge, it completes one cycle. This cycle count serves as a metric to track the usage and health of a battery.

What is the difference between charging and discharging a battery?

On the other hand, frequently charging a battery from a lower charge level is generally less stressful for the battery and can extend its overall lifespan. Charging a battery from 20% to 80%, for example, counts as only 0.5 cycle, whereas fully discharging and then charging it again counts as 1 cycle.
