## Overview

---

What is an uninterruptible power supply (UPS)?

Uninterruptible power supplies (UPS) are essential to ensure you have continuous power during a power outage. From a small UPS to save and shut down your PC, to large commercial systems that power large data centers or critical systems in hospitals, we have the solutions you and your customers demand.

What is the difference between a generator and a ups?

A generator provides standby power until the mains power can be reinstated during a power outage. This is supported by a UPS (Uninterruptible Power Supply) which ensures a seamless transition from your mains power to your backup power supply. Batteries provide power to your UPS and generator. What does UPS commissioning involve?

.

Why should you use an UPS system in industrial settings?

In industrial settings, UPS systems provide reliable backup power for digital control systems and industrial networks, allowing continuous operation during power outages. Having backup power, minimizes downtime, reduces the risk of equipment damage and maintains the integrity of industrial processes.

What happens if a UPS battery goes out?

When a power outage occurs, a UPS will immediately switch to battery power to provide a continuous power supply to connected equipment. However, the UPS batteries have a limited runtime, so a generator is needed to provide long-term power protection. When initiated the UPS will send a signal to the generator to start up.
