# New energy solar container lithium battery station cabinet vibration

## Overview

---

Do Lib batteries have a high energy density?

Although LIBs have high energy density, their driving range is considerably lower than that of vehicles with internal combustion engines (ICE). Multiple factors reduce the energy density of batteries, such as road vibrations, local vibrations, and thermal issues (Grunditz and Thiringer 2016).

Is there research available on battery placement in EV modules & packs?

Limited research is available on battery placement in EV modules and packs for vibration isolation as the research and development programs of all EV manufacturers are internal owing to the confidentiality factor.

Are EV batteries more vulnerable to NVH?

The inclusion of more batteries in the battery pack can potentially render batteries more vulnerable to the impacts of NVH originating from the above-mentioned EV components. With an increased battery level in the pack, LIBs in EVs are more vulnerable to global and local vibrations. 3. LIBs
