

Swaziland monitoring UPS uninterruptible power supply production

Overview

Can a STM32 microcontroller monitor ups power status?

Abstract: This paper presents the design of a UPS (Uninterruptible Power Supply) power monitoring system based on the STM32 microcontroller, aimed at achieving real-time monitoring of UPS power status and precise analysis of performance parameters.

What is ups monitoring?

UPS monitoring is the process of monitoring the different metrics of UPS devices in a network, including voltage, current, battery status, and charge, so they are always up, available, and working. Monitoring critical performance metrics is crucial for maintenance, uptime, and to upgrade your power system to handle extended outages.

Why is ups a good choice for monitoring and management?

Furthermore, the system exhibits good scalability and user-friendliness, allowing for the addition of more functions according to practical needs. This research is significant for enhancing the efficient monitoring and management of UPS power systems and advancing the intelligent development in related fields.

How do I monitor the performance of my ups?

Monitor the performance of any UPS device from any vendor. Just enter the system object identifier (sysOID), and obtain full-fledged custom SNMP monitoring to monitor any custom metric of your choice. Configure your UPSs to send traps to Site24x7 so you can receive instant notifications with a processed trap message once an issue is detected.
