UPS uninterruptible power supply does not invert when it has power

Overview

What is an uninterruptible power supply (UPS)?

In modern power systems, an Uninterruptible Power Supply (UPS) plays a critical role in providing power backup to essential equipment. As the core component of a UPS system, the inverter determines the overall performance and reliability of the UPS.

Can a ups switch from inverter to mains?

The UPS can only work in the inverter state and cannot switch to the mains working state. UPS failure analysis: The inability to convert the inverter power supply to the mains power supply indicates that there is a fault in the conversion part of the inverter power supply to the mains power supply. The following should be focused on detecting:..

What is a ups inverter?

The inverter in the UPS system is between the rectifier and static switch and is the core part of the UPS device. The main role of the inverter is to convert the rectifier or battery output DC power into 50Hz AC power, send it to the static switch, and finally supply it to the load equipment.

What is ups & how does it work?

UPS (Uninterruptible Power System) is mainly composed of rectifier, inverter (such as 2000w inverter or 3000w inverter), static bypass and energy storage device. It is an independent power supply with high reliability, high availability and high quality.
