

Wind-solar-diesel-storage project

Overview

The wind-solar-diesel-storage integrated energy storage system integrates wind energy, solar energy, diesel generators and energy storage devices (such as lithium batteries) to form a multi-energy complementary energy supply system. What is a wind storage system?

A storage system, such as a Li-ion battery, can help maintain balance of variable wind power output within system constraints, delivering firm power that is easy to integrate with other generators or the grid. The size and use of storage depend on the intended application and the configuration of the wind devices.

What is co-locating energy storage with a wind power plant?

Co-locating energy storage with a wind power plant allows the uncertain, time-varying electric power output from wind turbines to be smoothed out, enabling reliable, dispatchable energy for local loads to the local microgrid or the larger grid.

Should wind power plants have integrated storage?

To expand on the grid support capabilities of wind-storage hybrids, GE conducted a study on wind power plants with integrated storage on each turbine rather than central storage, along with an extra inverter and transformer for redundancy (Miller 2014). There are always some trade-offs involved in choosing a storage topology.

What is integrated storage in a wind turbine?

This type of storage is known as an integrated storage in the DC link of the wind turbine. A recent master's degree thesis at the Norwegian University of Science and Technology evaluated the modular multilevel converter for medium-voltage integration of a battery in the DC link (Rekdal 2018).
